

ABSTRACT OF THE DISCLOSURE

To provide a printer apparatus for a thermosensible adhering sheet capable of realizing small-sized formation/light-weighted formation and capable of shortening a time period required for printing processing/thermally activating processing. In a printer apparatus for a thermosensible adhering sheet, the printer apparatus comprising printing means for printing a printable face of a thermosensible adhering sheet constituted by forming a thermosensible adhesive layer on other face of a sheet-like base member having the printable face on one face thereof, carrying means arranged to be opposed to the printing means for carrying the thermosensible adhering sheet in a predetermined direction, and controlling means for carrying out a control when the thermosensible adhering sheet is subjected to a printing processing and a thermally activating processing, the carrying means includes thermally activating means for heating the thermosensible adhesive layer to thermally activate, and the controlling means subjects the thermosensible adhesive layer to the thermally activating processing by controlling the thermally activating means while subjecting the printable face to the printing processing by controlling the printing means.
